

A System and Method for Identifying Inconsistencies in Duplicate Digital Videos

Abstract

A system for checking the consistency between a digital video master and a duplicate video. Both the digital video master and the duplicate digital video have digital data, the digital data composed of a plurality of data segments. A loader module receives the digital data of the digital video master and the duplicate digital video. A comparison module then retrieves the digital data of the digital video master and the duplicate digital video and performs a data segment by data segment comparison between the digital data of the digital video master and the digital data of the duplicate digital video. The comparison module indicates any discrepancies between the digital video master and the duplicate digital video.
